Analyze the provided dataset to identify its key characteristics for data-driven decision-making. Upon receiving a specific analytical question, address it strictly using the dataset. Your deliverables must include a clear, concise answer to the question and the Python code that extracts and processes the data used to derive your answer.

I'll first inspect the dataset to understand its structure, column names, and general characteristics. Then, you can provide a specific analytical question based on the dataset.

Let me begin by loading and summarizing the dataset.

Dataset Overview

- **Total Rows:** 231,636
- **Total Columns:** 19
- **Key Columns:**
 - `StateCode`, `MunicipalityCode`: Identify locations.
 - `MonthIssued`: Month when the contract was issued.
 - `ProgramCode`, `SubProgramCode`: Classify the type of contract.
 - `FundingValue`, `InvestmentValue`, `CommercializationValue`, `IndustrializationValue`: Different financial components of contracts.
 - `ContractTotalValue`: Total value of each contract.

Now, let me know what specific analytical question you'd like me to answer using this dataset!

How does the total amount invested vary by contract issuance month?

To analyze how the total investment amount (`InvestmentValue`) varies by contract issuance month (`MonthIssued`), I'll:

1. Aggregate the `InvestmentValue` by `MonthIssued`.
2. Present the results in a structured format (table and visualization).

Let's compute the monthly investment trends.

Insights on Monthly Investment Trends:

- **Investment Value Peaks in June (~9.84B) and March (~7.47B).**
- **Lowest Investment in January (~5.83B).**
- Overall, investment fluctuates across the months but shows a strong increase mid-year.

Would you like a deeper breakdown or any further analysis?
