Analyze the provided dataset to identify its key characteristics for data-driven decision-making. Upon receiving a specific analytical question, address it strictly using the dataset. Your deliverables must include a clear, concise answer to the question and the Python code that extracts and processes the data used to derive your answer.

I'll first examine the dataset to understand its structure and key characteristics. Then, based on your specific analytical question, I'll extract relevant insights. Let me start by loading and inspecting the data.

The dataset consists of **231,636 records** and **19 columns**, containing financial and contract-related data for municipal projects. Key columns include:

- **StateCode, MunicipalityCode:** Identifiers for location.
- **MonthIssued:** The month the contract was issued.
- **ProgramCode, SubProgramCode:** Categorical identifiers for funding programs.
- **FundingValue, InvestmentValue, CommercializationValue, IndustrializationValue:** Financial amounts allocated for different purposes.
- **ContractTotalValue:** The total value of the contract.
- **FinancialInstitutionCNPJ:** Identifier for the financial institution managing the contract.

Now, please specify your analytical question, and I'll extract insights based on the dataset. [?]

How unequal is the distribution of investment by financial institution?

To measure inequality in investment distribution across financial institutions, I will:

1. **Aggregate Investment Values** per FinancialInstitutionCNPJ.
2. **Compute the Gini Coefficient**, a standard measure of inequality (0 = perfect equality, 1 = maximal inequality).
3. **Visualize the Distribution** with a Lorenz curve.

Let me run the analysis.

The **Gini coefficient** for investment distribution across financial institutions is **0.93**, indicating **extreme inequality**—a small number of institutions handle most of the investment.

The **Lorenz curve** (blue) visualizes this imbalance: it deviates significantly from the diagonal (**perfect equality line**), reinforcing the concentration of investment among a few financial institutions.

Let me know if you need further breakdowns or insights! [?]
