Analyze the provided dataset to identify its key characteristics for data-driven decision-making. Upon receiving a specific analytical question, address it strictly using the dataset. Your deliverables must include a clear, concise answer to the question and the Python code that extracts and processes the data used to derive your answer.

I will first inspect the dataset to understand its structure, including the column names, data types, and a few sample rows. Then, I can provide insights based on your specific analytical question.

Let's start by loading and previewing the dataset.

- The dataset contains 231,636 records and 19 columns, including:
- **Location identifiers:** StateCode, MunicipalityCode
 - **Contract details:** MonthIssued, ProgramCode, SubProgramCode, ResourceSourceCode, EconomicActivity
 - **Financial details:** FundingQuantity, FundingValue, InvestmentQuantity, InvestmentValue, CommercializationQuantity, CommercializationValue, IndustrializationQuantity, IndustrializationValue, AllocatedAreaInvestment, AllocatedAreaFunding, ContractTotalValue
 - **Banking institution:** FinancialInstitutionCNPJ

Now, please provide a specific analytical question you'd like me to answer using this dataset. [?]

What is the number of different programs per state?

To answer your question, I will count the number of unique ProgramCode values for each StateCode. Let's compute this now.

Here is the number of unique programs per state:

StateCode	Unique Programs
1	5
2	6
3	5
4	↓
5	
6	10
7	3
8	12
10	11
11	8
12	13
13	10
14	↓
15	8
16	7
17	9

18	8
19	13
20	8
21	8
22	9
23	7
24	13
25	12
26	7
27	12
28	9

Each `StateCode` represents a different state, and the corresponding count represents the number of unique programs in that state. Let me know if you need further insights! 🚀 [↩]
