Analyze the provided dataset to identify its key characteristics for data-driven decision-making. Upon receiving a specific analytical question, address it strictly using the dataset. Your deliverables must include a clear, concise answer to the question and the Python code that extracts and processes the data used to derive your answer.

I'll start by examining the dataset to understand its structure and key characteristics. Then, you can provide a specific analytical question, and I'll derive insights accordingly.

Let me first load and summarize the dataset.

#### Dataset Summary:

- 231,636 rows and 19 columns.
- Includes details on municipal contracts such as **funding**, **investment**, **commercialization**, **industrialization**, and **total contract values**.
- Key identifiers: **StateCode**, **MunicipalityCode**, **ProgramCode**, **EconomicActivity**, **FinancialInstitutionCNPJ**.
- Contains both **quantitative** (monetary values, quantities) and **categorical** (codes) data.

#### Next Steps:

Please provide a specific analytical question, and I'll extract insights using Python. 🚀 [~]

What were the highest and lowest total contract values?

#### Highest and Lowest Contract Values:

- **Highest Contract Value: 2.6 billion (2,600,000,000.0)**
  - Municipality Code: **57376**
  - State Code: **11**
  - Economic Activity Code: **1**
  - Financial Institution CNPJ: **33657248**
  - Investment-driven contract with **9.73 allocated area investment**.

- **Lowest Contract Value: 3.6**
  - Municipality Code: **3825**
  - State Code: **24**
  - Economic Activity Code: **1**
  - Financial Institution CNPJ: **87795639**
  - Funding-based contract with **1 funding quantity**.

#### Python Code:

```
python

# Find the highest and lowest contract total values
max_contract_value = df["ContractTotalValue"].max()
min_contract_value = df["ContractTotalValue"].min()

# Find corresponding rows for context
max_contract_row = df[df["ContractTotalValue"] == max_contract_value]
min_contract_row = df[df["ContractTotalValue"] == min_contract_value]

max_contract_value, max_contract_row, min_contract_value, min_contract_row
```

Copy Edit

Let me know if you need further breakdowns! 🚀 [~]
