Analyze the provided dataset to identify its key characteristics for data-driven decision-making. Upon receiving a specific analytical question, address it strictly using the dataset. Your deliverables must include a clear, concise answer to the question and the Python code that extracts and processes the data used to derive your answer.

I have received your dataset: `sicor_municipal_contracts.csv`. I'll first inspect its structure to understand the key characteristics. Then, you can provide a specific analytical question, and I'll analyze the data accordingly. Let me start by loading and summarizing the dataset.

Dataset Overview

- Rows: 231,636
- Columns: 19
- Key Fields:
  - Geographical Info: `StateCode`, `MunicipalityCode`
  - Contract Details: `MonthIssued`, `ProgramCode`, `SubProgramCode`
  - Financial Data: `FundingValue`, `InvestmentValue`, `CommercializationValue`, `IndustrializationValue`, `ContractTotalValue`
  - Other: `EconomicActivity`, `ResourceSourceCode`, `FinancialInstitutionCNPJ`

It looks like this dataset tracks municipal contracts, focusing on financial allocations and investments.

Next Steps

- What specific question do you want answered from this dataset?
- Possible analyses:
  - Total contract values by state or municipality
  - Trends in funding over time
  - Largest contracts by economic activity
  - Investment vs. commercialization breakdown

Let me know what you'd like to explore! 🚀 🔄

⬇ is the proportion of investment value per month?

To calculate the **proportion of investment value per month**, I'll:

1. Sum the **InvestmentValue** for each month ( `MonthIssued` ).
2. Compute the proportion of each month's investment relative to the total investment value.
3. Present the results in a structured format.

Let's analyze the data.

Proportion of Investment Value per Month:

| Month        | Investment Proportion (%) |
|--------------|---------------------------|
| January (1)  | 13.39%                    |
| February (2) | 14.00%                    |
| March (3)    | 17.14%                    |
| April (4)    | 16.64%                    |
| May (5)      | 15.24%                    |

June (6)

22.59%

This shows that **June has the highest proportion of investment value (22.59%)**, while January has the lowest (13.39%).

#### Python Code Used:

```
python
# =====
monthly_investment = df.groupby("MonthIssued")["InvestmentValue"].sum()

# Calculate the proportion of each month's investment
monthly_investment_proportion = (monthly_investment / monthly_investment.sum()) * 100

# Convert to DataFrame for better readability
investment_proportion_df = monthly_investment_proportion.reset_index()
investment_proportion_df.columns = ["MonthIssued", "InvestmentProportion (%)"]

# Display the result
investment_proportion_df
```
