Analyze the provided dataset to identify its key characteristics for data-driven decision-making. Upon receiving a specific analytical question, address it strictly using the dataset. Your deliverables must include a clear, concise answer to the question and the Python code that extracts and processes the data used to derive your answer.

I have received your dataset: `sicor_municipal_contracts.csv`. I'll first examine its structure to understand its contents. Then, you can provide a specific analytical question, and I'll generate insights based strictly on the dataset.

Let me start by loading and summarizing the dataset.

Dataset Overview:

- Rows: 231,636
- Columns: 19
- Key Fields:
 - `StateCode`, `MunicipalityCode` (Location identifiers)
 - `MonthIssued` (Contract issuance month)
 - `FundingValue`, `InvestmentValue`, `CommercializationValue`, `IndustrializationValue`, `ContractTotalValue` (Financial data)
 - `EconomicActivity` (Categorization of contracts)
 - `FinancialInstitutionCNPJ` (Institution handling the contract)

The dataset appears to track municipal contracts, their funding sources, and associated economic activities.

Next Steps:

What specific analysis would you like me to perform? Examples:

- Total contract value per state/municipality
- Trend analysis of contracts over time
- Distribution of funding by economic activity
- Any other business-related question?

Let me know your focus!

each specific program?

To determine which municipality recorded the highest total investment value for each program, I'll:

1. Group the data by `ProgramCode` and `MunicipalityCode`.
2. Sum the `InvestmentValue` for each group.
3. Identify the municipality with the highest investment value for each program.

Let's extract this information now.

Results:

Here are the municipalities with the highest total investment value for each program:

ProgramCode	MunicipalityCode	InvestmentValue
1	5287	79,158,950
50	49676	6,851,089
70	26053	1,359,500

151	28549	60,000,000
152	17990	15,131,720
153	48361	8,834,140
154	29579	23,865,210
155	2819	51,163,400
162	4563	25,105,560
163	31701	47,224,670
201	55433	9,587,800
222	35271	26,546,200
999	57376	2,606,840,000

The highest investment overall is **Program 999 in Municipality 57376**, totaling **2.6 billion**.

Python Code Used:

```
python
# Group by ProgramCode and MunicipalityCode, summing the InvestmentValue
investment_summary = df.groupby(["ProgramCode", "MunicipalityCode"])["InvestmentValue"].sum().reset_index()

# Get the municipality with the highest investment value per program
max_investment_per_program = investment_summary.loc[investment_summary.groupby("ProgramCode")["InvestmentValue"].idxmax()]

# Display results
print(max_investment_per_program)
```

Would you like any additional insights, such as mapping municipalities to names or visualizing trends? [\[>\]](#)
