Analyze the provided dataset to identify its key characteristics for data-driven decision-making. Upon receiving a specific analytical question, address it strictly using the dataset. Your deliverables must include a clear, concise answer to the question and the Python code that extracts and processes the data used to derive your answer.

I'll start by examining the dataset to understand its structure and key characteristics. Then, you can provide a specific analytical question, and I'll address it strictly using the dataset.

Let me first load and preview the data.

The dataset contains 231,636 rows and 19 columns. Here are some key characteristics:

- It includes financial and economic data related to municipal contracts.
- Some key columns:
 - `StateCode`, `MunicipalityCode`: Geographic identifiers.
 - `MonthIssued`: Indicates when the contract was issued.
 - `FundingValue`, `InvestmentValue`, `CommercializationValue`, `IndustrializationValue`, `ContractTotalValue`: Represent different financial aspects of the contracts.
 - `EconomicActivity`: Categorizes the type of economic activity.
 - `FinancialInstitutionCNPJ`: Identifies the financial institution involved.

Now, please provide a **specific analytical question**, and I will extract insights based on the dataset. 🚀 🤖

How does the subprogram classification influence the total contract value?

To analyze how the **subprogram classification** (`SubProgramCode`) influences the **total contract value** (`ContractTotalValue`), I'll compute:

1. The **average contract value** for each `SubProgramCode`.
2. The **total contract value** distributed across different subprograms.
3. A summary of variations in contract value across subprograms.

Let's run the analysis! 🚀

Influence of SubProgramCode on Total Contract Value

1. **Most significant subprogram** (`SubProgramCode = 0`):
 - Holds the **largest total contract value** (~125 billion).
 - Has **97,937 contracts**, with an **average value of ~1.28 million per contract**.
2. **Other major subprograms**:
 - `SubProgramCode = 1`: **12.8 billion total**, **62,374 contracts**, **~205K per contract**.
 - `SubProgramCode = 2`: **6.7 billion total**, **34,825 contracts**, **~193K per contract**.
 - `SubProgramCode = 56`: **3.7 billion total**, **19,257 contracts**, **~194K per contract**.
3. **Notable high-value outliers**:
 - `SubProgramCode = 24`: **Only 103 contracts**, but an **average contract value of 6.4 million**.
 - `SubProgramCode = 41`: **85 contracts**, but an **average of 6.4 million per contract**.

Key takeaways

- Some subprograms (e.g., `0`, `1`, `2`, `56`) handle **large volumes of contracts**, resulting in high total values.
- Others (`24`, `41`) have **fewer contracts but much higher individual contract values**, indicating possible high-investment projects.

- The subprogram classification **strongly influences** the contract value distribution, highlighting different financial strategies.
